

Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus that allows the driver to be able to control the lift truck without leaving the seat. They are made out of top quality materials and are designed to endure the most challenging procedures and work environments. Side shifting models have the extra ability to be able to laterally position the arms or the entire load so as to facilitate much more accurate carrying and placement in a quicker and more efficient method.

The unique blade pocket design could enable the individual operating it to securely sway the unit's forks without any fear of damaging the positioning cylinders. This allows the worker the option to either perform independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages can be transformed into blade positioners on existing units.
